

#### **Consistency Issues**

- · Web pages tend to be updated over time
  - Some objects are static, others are dynamic
  - Different update frequencies (few minutes to few weeks)
- · How can a proxy cache maintain consistency of cached data?
  - Send invalidate or update
  - Push versus pull

University of Massachusetts Compsci 677: Distributed and OS Amherst

# Push-based Approach Server tracks all proxies that have requested objects

- If a web page is modified, notify each proxy
- Notification types
  - Indicate object has changed [invalidate]
  - Send new version of object [update]
- · How to decide between invalidate and updates?
  - Pros and cons?
  - One approach: send updates for more frequent objects, invalidate for rest

push

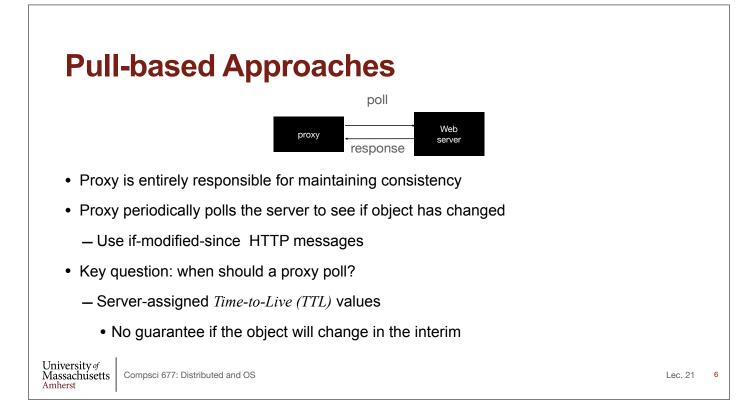

proxy

## **Push-based Approaches**

#### • Advantages

- Provide tight consistency [minimal stale data]
- Proxies can be passive
- Disadvantages
  - Need to maintain state at the server
    - Recall that HTTP is stateless
    - Need mechanisms beyond HTTP
  - State may need to be maintained indefinitely
    - Not resilient to server crashes

University of Massachusetts Compsci 677: Distributed and OS Amherst

Lec. 21

#### **Pull-based Approach: Intelligent Polling**

- Proxy can dynamically determine the refresh interval
  - Compute based on past observations
    - Start with a conservative refresh interval
    - Increase interval if object has not changed between two successive polls
    - Decrease interval if object is updated between two polls
    - Adaptive: No prior knowledge of object characteristics needed

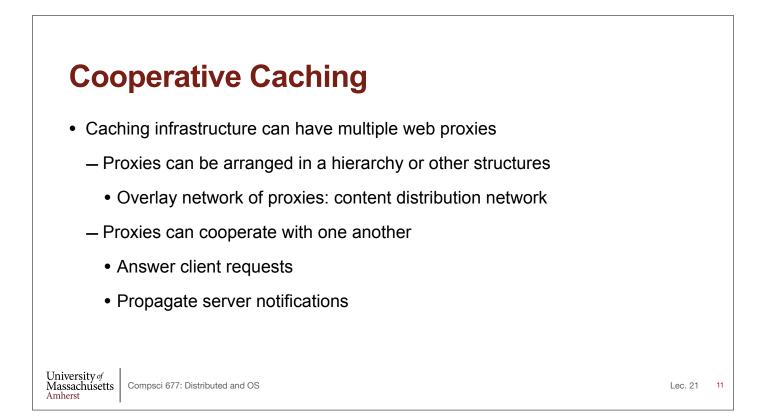

## Pull-based Approach

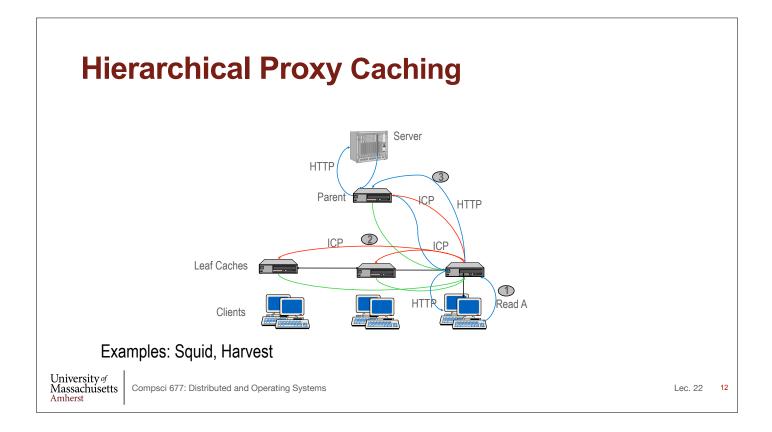

- Advantages
  - Implementation using HTTP (If-modified-Since conditional GET)
  - Server remains stateless
  - Resilient to both server and proxy failures
- Disadvantages
  - Weaker consistency guarantees (objects can change between two polls and proxy will contain stale data until next poll)
    - Strong consistency only if poll before every HTTP response
  - More sophisticated proxies required
  - High message overhead

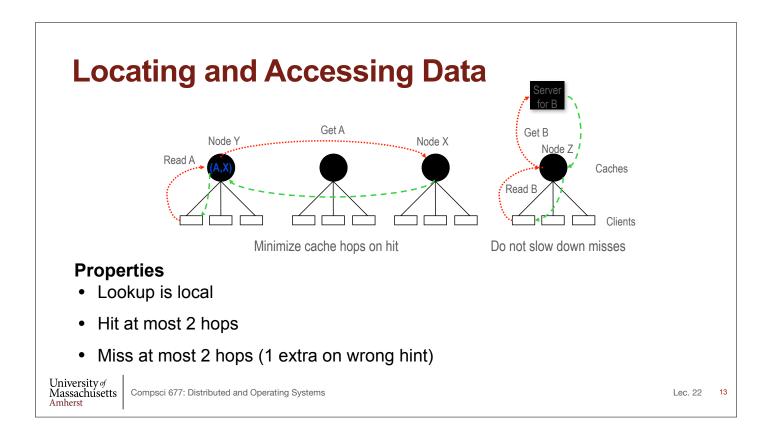

Lec. 21

A Hybrid Approach: Leases	
Lease: duration of time for which server agrees to notify proxy of modification	
<ul> <li>Issue lease on first request, send notification until expiry</li> </ul>	
<ul> <li>Need to renew lease upon expiry</li> </ul>	
<ul> <li>Smooth tradeoff between state and messages exchanged</li> </ul>	
<ul> <li>Zero duration =&gt; polling, Infinite leases =&gt; server-push</li> </ul>	
Efficiency depends on the <i>lease duration</i> Get + lease req	
Client read Proxy Reply + lease Server	
University of Massachusetts Amherst	Lec. 21 9

Policies for Leases Duration		
Age-based lease		
<ul> <li>Based on bi-modal nature of object lifetimes</li> </ul>		
<ul> <li>Larger the expected lifetime longer the lease</li> </ul>		
Renewal-frequency based		
<ul> <li>Based on skewed popularity</li> </ul>		
<ul> <li>Proxy at which objects is popular gets longer lease</li> </ul>		
Server load based		
<ul> <li>Based on adaptively controlling the state space</li> </ul>		
<ul> <li>Shorter leases during heavy load</li> </ul>		
University of Massachusetts Amherst	Lec. 21	10

#### **Edge Computing** · Web caches effective when deployed close to clients • At the "Edge" of the network · Edge Computing: paradigm where applications run on servers located at the edge of the network Benefits · Significantly lower latency than "remote" cloud servers · Higher bandwidth · Can tolerate network or cloud failures · Complements cloud computing · Cloud providers offer edge servers as well as cloud servers University of Compsci 677: Distributed and OS Massachúsetts Lec. 21 14 Amherst

### **Edge Computing Origins**

- · Origins come from mobile computing and web caching
- · Content delivery networks
  - · Network of edge caches deployed as commercial service
  - · Cache web content (especially rich content: images, video)
  - Deliver from closest edge proxy server
- · Mobile computing
  - · devices has limited resources, limited battery power
  - · computational offload: offload work to more capable edge server
  - · low latency offload important for interactive mobile applications
  - edge server sends results to the mobile

University of Massachusetts Amherst

Compsci 677: Distributed and OS

### **Content Delivery Networks**

- · Global network of edge proxies to deliver web content
  - edge clusters of varying sizes deployed in all parts of the world
  - Akamai CDN: 120K servers in 1100 networks, 80 countries
- · Content providers are customers of CDN service
  - Examples: news sites, image-rich online stores, streaming sites
  - · Decide what content to cache/offload to CDN
  - Embed links to cdn content: <u>http://cdn.com/company/foo.mp4</u>
  - · Consistency responsibility of content providers
- · Users access website normally
  - · Some content fetched by browser from CDN cache

University of Massachusetts Amherst

Compsci 677: Distributed and OS

Lec 21

#### **CDN Request Routing**

- Web request need to be directed to nearby CDN server
- Two level load balancing
  - Global: decide which cluster to use to serve request
  - · Local: decide which server in the cluster to use
- DNS-based approach is common
  - Special DNS server: resolve www.cnn.com/newsvideo.mp4
  - DNS checks location of client and resolves to IP address of nearby CDN server
  - · Different users will get resolved to different edge locations

University of Massachusetts Compsci 677: Distributed and OS Amherst

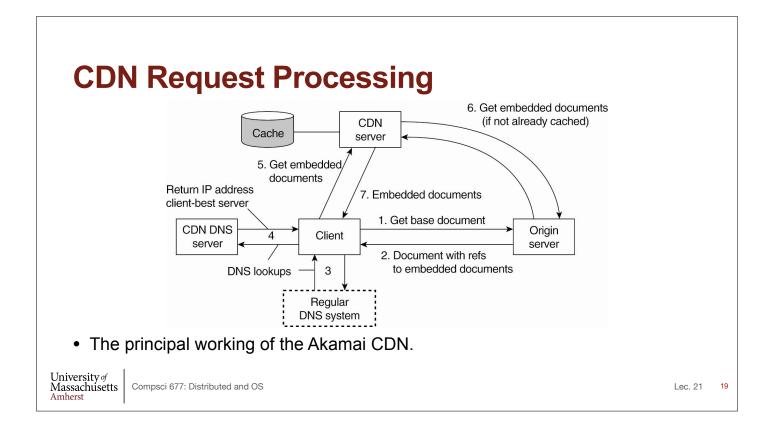

#### **CDN** Issues

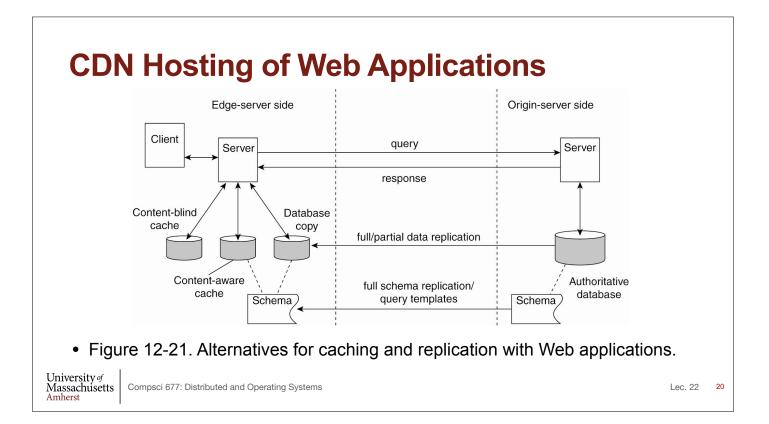

- Which proxy answers a client request?
  - Ideally the "closest" proxy
  - Akamai uses a DNS-based approach
- · Propagating notifications
  - Can use multicast or application level multicast to reduce overheads (in push-based approaches)
- · Active area of research
  - Numerous research papers available

University of Massachusetts Amherst

Compsci 677: Distributed and OS

Lec. 21

#### **Mobile Edge Computing**

- Use case: Mobile offload of compute-intensive tasks
- Example: augmented reality, virtual reality (mobile AR/VR)
  - mobile phone or headset has limited resources, limited battery
  - · Low latency / response times for interactive use experience
  - · mobile devices may lack a GPU or mobile GPU may be limited
- Today's smartphones are highly capable (multiple cores, mobile GPU, neural processor)
  - mobile offload more suitable for less capable devices (e.g., AR headset)
- 5G cellular providers: deploy edge servers near cell towers
  - · industrial automation, autonomous vehicles

University of Massachusetts Compsci 677: Distributed and OS Amherst

#### **Edge Computing Today**

- · Emerging approach for latency-sensitive applications
- Edge AI: run AI (deep learning) inference at edge
  - · home security camera sends feed, run object detection
- · Low latency offload: autonomous vehicles, smart city sensors, smart home etc.
- · Edge computing as an extension to cloud
  - Cloud regions augmented by local regions
    - Local regions are edge clusters that offer normal cloud service (but at lower latency) E.g., AWS Boston region
  - · Internet of Things (IoT) data processing sevices

University of Massachusetts Amherst Lec. 21
